NUBRA · PRODUCT MANAGEMENT INTERN CASE · PROBLEM 03, POST-TRADE REVIEW

TradeLens: the monthly review that names the habits costing you money

Bhavya Mohnot · October 2026

My take on the problem

Traders don't skip reviews out of laziness; reviewing is hard. A tradebook is hundreds of buy/sell rows, and a P&L report says *how much* you lost, not *what to change*. The losses that matter are repeated behaviours: the instrument that never works for you, the expiry-day option punt, the trade taken ten minutes after a loss. Each is invisible one trade at a time and obvious across a month.

87.7%
of individual F&O traders lost money in FY26

₹91,685 cr
lost by individual traders in total

~90%
of those who lost two years running, and kept trading, lost again

People keep trading; they don't keep learning.

> So the job is not "more analytics". It is to take a month of raw order history, name the **two or three habits that cost the most rupees**, prove each with the actual trades, and hand back **one rule to try next month**.

Why Nubra should solve it

- **It already has the data.** Nothing to export or upload; the review can arrive on the 1st of every month.
- **The right users.** Nubra is built for active traders, scalpers and options strategists, which is where habits compound fastest.
- **It can close the loop.** A journal app can only tell you about a habit. Nubra can turn it into a guardrail at the moment of decision: an expiry-day nudge on the order ticket, a cool-off after three losses, or pausing an instrument on a smart watchlist.
- **Retention.** Traders who blow up their accounts churn. Helping them lose less is good for them and for lifetime value.

The solution space

OPTION	WHY NOT (OR WHY)
P&L dashboard (Console-style)	Answers "how much", not "what to change"; most traders never open it
Trade journal (TradeZella, Tradervue)	Needs manual tagging; too much effort for most retail traders
AI chat over your trades	Flexible but hard to verify; a confident wrong rupee figure does real damage
Opinionated monthly review (chosen)	Deterministic checks, ranked by ₹, at most three, each with evidence and a rule

1. **Rank by marginal ₹.** If BANKNIFTY losses and closing-hour losses are the same trades, they count once, and the closing hour is cleared.
2. **Don't invent problems.** A habit must cover at least 5% of the month's losses and be statistically worse than the trader's other trades. Everything checked and cleared is shown, for example "your quick re-entries made +₹650".
3. **Plain words, no motive-guessing.** It says "jumping back in within 15 minutes of a loss", never "revenge trading".

In scope (v1)

- One month of NSE equity/F&O order history: a broker tradebook CSV/XLSX, or a closed-trade sheet.
- Round-trip rebuild from fills (scale-ins, partial exits, shorts), with charges estimated when the file has none.
- Nine habit checks: an instrument that keeps losing · trading on after three losses · quick re-entry after a loss · overtrading · a losing time of day · expiry-day options · holding losers longer than winners · sizing up after a loss · charges eating small trades.
- A one-rule commitment, checked against next month's review.
- Runs entirely in the browser; the file never leaves the device.

Out of scope

- Live positions and margin (problem 02).
- Broker API sync.
- Grouping multi-leg strategies (each leg is reviewed on its own).
- Intraday price paths, so no "you exited too early" claims.
- Tax P&L, guessing emotions, free-form AI chat.

How I'd know it works

- **Adoption:** the share of monthly active traders who open the review, and the share who commit to a rule.
- **Outcome (north star):** the ₹ cost of the committed habit the following month against its baseline. Target: at least a 20% drop for half of committers.
- **Trust:** the "this is wrong" rate per habit card; a high rate means re-tuning or removing that check.
